

# FOCUSED PRACTICE IN HOSPITAL MEDICINE Blueprint

For traditional, 10-year Maintenance of Certification (MOC) exam

## ABIM invites diplomates to help develop the Hospital Medicine MOC exam blueprint

Based on feedback from physicians that MOC assessments should better reflect what they see in practice, in 2016 the American Board of Internal Medicine (ABIM) invited all certified hospitalists and those enrolled in the focused practice program to provide ratings of the relative frequency and importance of blueprint topics in practice.

This review process, which resulted in a new MOC exam blueprint, will be used on an ongoing basis to inform and update all MOC assessments created by ABIM. No matter what form ABIM's assessments ultimately take, they will need to be informed by front-line clinicians sharing their perspective on what is important to know.

A sample of over 100 hospitalists, similar to the total invited population of hospitalists in age, gender, geographic region, and time spent in direct patient care, provided the blueprint topic ratings. ABIM used this feedback to update the blueprint for the traditional, 10-year MOC exam (beginning with the Fall 2016 administration).

To inform how assessment content should be distributed across the major blueprint content categories, ABIM considered the average respondent ratings of topic frequency and importance in each of the content categories. A second source of information was the relative frequency of patient conditions in the content categories, as seen by certified hospitalists and documented by national health care data (described further under *Content distribution* below).

To determine prioritization of specific assessment content within each major medical content category, ABIM used the respondent ratings of topic frequency and importance to set thresholds for these parameters in the exam assembly process (described further under *Detailed content* outline below).

## Purpose of the Hospital Medicine MOC Assessments

The MOC assessments is designed to evaluate the knowledge, diagnostic reasoning, and clinical judgment skills expected of the certified hospitalist in the broad domain of the discipline. The exam emphasizes diagnosis and management of prevalent conditions, particularly in areas where practice has changed in recent years. As a result of the blueprint review by ABIM diplomates, the MOC assessments places less emphasis on rare conditions and focuses more on situations in which physician intervention can have important consequences for patients. For conditions that are usually managed by other specialists, the focus is on recognition rather than on management. The assessment is developed jointly by the ABIM and the American Board of Family Medicine.

## Assessment format

The traditional, 10-year MOC exam is composed of 220 single-best-answer multiple-choice questions, of which approximately 50 are new questions that do not count in the examinee's score. Examinees taking a traditional, 10-year MOC exam will have access to an external resource (i.e., UpToDate®) for the entire exam.

More information on how exams are developed can be found at [abim.org/about/exam-information/exam-development.aspx](http://abim.org/about/exam-information/exam-development.aspx).

Most questions describe patient scenarios and ask about the work done (that is, tasks performed) by physicians in the course of practice:

- **Diagnosis:** making a diagnosis or identifying an underlying condition
- **Testing:** ordering tests for diagnosis, staging, or follow-up
- **Treatment/Care Decisions:** recommending treatment or other patient care
- **Risk Assessment/Prognosis/Epidemiology:** assessing risk, determining prognosis, and applying principles from epidemiologic studies
- **Pathophysiology/Basic Science:** understanding the pathophysiology of disease and basic science knowledge applicable to patient care

ABIM is committed to working toward health equity and believes that board-certified physicians should have an understanding of health care disparities. Therefore, health equity content that is clinically important to each discipline will be included in assessments, and the use of gender, race, and ethnicity identifiers will be re-evaluated.

Clinical information presented may include patient photographs, radiographs, electrocardiograms, and other media to illustrate relevant patient findings. Exam tutorials, including examples of question format, can be found at [abim.org/maintenance-of-certification/exam-information/hospital-medicine/exam-tutorial.aspx](http://abim.org/maintenance-of-certification/exam-information/hospital-medicine/exam-tutorial.aspx).

## Content distribution

Listed below are the major medical content categories that define the domain for the Hospital Medicine traditional, 10-year MOC exam. The relative distribution of content is expressed as a percentage of the total assessment. To determine the content distribution, ABIM considered the average respondent ratings of topic frequency and importance. To cross-validate these self-reported ratings, ABIM also considered the relative frequency of conditions seen in the National Hospital Discharge Survey. Informed by these data, the Hospital Medicine Approval Committee and Internal Medicine Board have determined the content category targets shown below.

CONTENT CATEGORY	TARGET %
Inpatient and transitional care:	<b>63.5%</b>
Cardiovascular disorders	<b>12%</b>
Pulmonary disease and critical care medicine	<b>12.5%</b>
Gastroenterologic and hepatic disorders	<b>10.5%</b>
Nephrologic and urologic disorders	<b>8.5%</b>
Endocrinologic disorders	<b>5%</b>
Hematologic and oncologic disorders	<b>3.5%</b>
Neurologic disorders	<b>7.5%</b>
Allergic, immunologic, dermatologic, and rheumatologic disorders	<b>4%</b>
Palliative care, medical ethics, and decision-making	<b>6.5%</b>
Consultative co-management	<b>15%</b>
Quality, safety, and clinical reasoning	<b>15%</b>
<b>Total</b>	<b>100%</b>

The Hospital Medicine MOC assessment may cover other dimensions of medicine as applicable to the medical content categories, such as infectious disease and clinical epidemiology.

## How the blueprint ratings are used to assemble the MOC assessment

Blueprint reviewers provided ratings of relative frequency in practice for each of the detailed content topics in the blueprint and provided ratings of the relative importance of the topics for each of the tasks described in *Assessment format* above. In rating importance, reviewers were asked to consider factors such as the following:

- High risk of a significant adverse outcome
- Cost of care and stewardship of resources
- Common errors in diagnosis or management
- Effect on population health
- Effect on quality of life
- When failure to intervene by the physician deprives a patient of significant benefit

Frequency and importance were rated on a three-point scale corresponding to low, medium, or high. The median importance ratings are reflected in the *Detailed content outline* below. The Hospital Medicine Approval Committee and Internal Medicine Board, in partnership with the physician community, have set the following parameters for selecting MOC assessment questions according to the blueprint review ratings:

- At least 75% of questions will address high-importance content (indicated in green)
- No more than 25% of questions will address medium-importance content (indicated in yellow)
- No exam questions will address low-importance content (indicated in red)

Independent of the importance and task ratings, no more than 20% of questions will address low-frequency content (indicated by “LF” following the topic description).

**Note:** The same topic may appear in more than one medical content category.

## Detailed content outline for the Hospital Medicine traditional, 10-year MOC exam

 – <b>High Importance:</b> At least 75% of questions will address topics and tasks with this designation.	 – <b>Medium Importance:</b> No more than 25% of questions will address topics and tasks with this designation.	 – <b>Low Importance:</b> No questions will address topics and tasks with this designation.
<b>LF – Low Frequency:</b> No more than 20% of questions will address topics with this designation, regardless of task or importance.		

<b>INPATIENT AND TRANSITIONAL CARE: CARDIOVASCULAR DISORDERS</b> (12% of exam)	Diagnosis	Testing	Treatment/ Care Decisions	Risk Assessment/ Prognosis/ Epidemiology	Pathophysiology/ Basic Science
